                                                                                                                                                                                                                            This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83081-ABA83169, ABA83180, ABA83181 and ABA83189). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring abatient in remission from ovarian cancer, in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovariant undour (i.e., an epithenial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenocarcinoma, concertioned, endometricid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, endometricid carcinoma, adenotibroma and Brenner tumour The ovarian tumour marker genes of the invention were identified oversor serous in manner esponse pathways, in the marker genes are membrane. Concertion and in protein folding, and many of these are membrane proliferation and in protein folding, and many of these are membrane and professed in addition to their use as diagnostic and

The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting for diagnosing cancer. The present sequence represents human cancer-cell specific antigen is useful for measuring HLA-F antigen and specific HLA-F antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  97 DGKDYISLNEDLRSWTAADTVAQITQRFYBAEEYAEEFRTYLEGECLELLRRYLENGKET 156

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of amarker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (SI) whose expression levels increase when respiratory epithelial calls are stimulated with interleukin-13; or (b) a group of genes (SI) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (5) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene a chronic obstructive pulmonary disease, on which a procein encoded by a marker gene; and (7) a DNA chip for testing for c expression of the gene through an RNAA effect or an antishody recognising a procein encoded by a marker gene; and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The procein encoded by a correction of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         156
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       140 DGKDYISLNEDLRSWTAADTVAQITQRFYEABEYAEBFRTYLEGECLELLRRYLENGKET 199
Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a healthy subject.

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas pancreatic islet, lung, bone marrow or stem cell transplant rejection, in mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammancory bowel diseases, multiple selectosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DGKDYISLNEDLRSWIAADTVAQIIQRFYBABEYABEFRIYLEGECLELLRRYLENGKET 156

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, laber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, antidiabetic, antidiabetic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      97 DGKDYISLNEDLRSWTAADTVAQITQRFYEAEEYAEEFRTYLEGSCLELLRRYLENGKET 156

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed converted in several in gene therapy techniques to restore normal sectivity of (II) as useful in generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on buk and amino acid sequences. Asgonoulo-Asganary responsible for generating envelopment on and to produce other types of data and products dependent on buk and amino acid sequences. Asgonoulo-Asganary note: The sequence data for this partent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence is a polypeptide encoded by one of a large number of F. ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 3' untranslated tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where inorger cDNA sequences have been obtained, the full 5' urg is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  44 IAVEYVDDTQFLRFDSDAAIPRMEPREPWVEQEGPQYWEWTTGYAKANAQTDRVALRNLL 103

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for Claim 45; SEQ ID NO 30718; 80pp; English. surveying tissues.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide acquences in the specification, or their complements or fragments, and ercoding at least 8 animo acids of any of the 6898 amino acid sequences ("Illy defined in the specification. The probe is a single exon probe that where they be stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human considerable from the plurality of probes stried above, where each of the plurality of probes is separately and addressably isolatable or manification a method of measuring human gene expression, a method of contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid soft any of the above according any of a single exon probe created and according acts and acts by subscription, and a computer-readable content and any acid and according any according any actors of a single exon probe according any actor according any according any actor according any according ac

Birse CE, Rosen CA;

WPI; 2002-147878/19. N-PSDB; ABQ56008 Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases.

Claim 11; SEQ ID NO 4063; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABO5411-ABD56305), and also encompasses polypeptides 90% identical and polymoulcotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens and the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens and the use of ovarian antigens, and the use of ovarian antigen polymoulcotides and polymoulcotides in diagnosing. Treating, prognosing or preventing various ovary and/or breast-related disorders (e.g., infectiolity, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian crand dysmenorthoes), endocrine disorders (e.g., chlamyla, HIV, toxoplasmostis, and toxic orbock syndrome), inflammatory conditions (e.g., mastifis, ophoritis and variants system disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypetides may be used for gene therapy, chromosome mapping, in the modulate ovarian antigen may also be used in screening for compounds which modulate ovarian antigen of the programe antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the program of the present sequence data for this parent did not form part of the printed sequence data for this parent did not form part of the printed sequence at the program of the invention. On the interpretation of independence mappers of the program of the pr

Sequence 107, Application US/08481985B
Patent No. 601146
GENERAL INFORMATION:
APPLICANT: Mottez, Estelle
APPLICANT: Applicatio, Jean-Pierre
APPLICANT: Kourilsky, Phillipe
TITLE OF INVENTION: Altered Major Histocompatibility Complex
TITLE OF INVENTION:
NUMBER OF SEQUENCES: 148
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ouery Match 10.6%; Score 29; DB 3; Length 274; Best Local Similarity 100.0%; Pred.
